

INFORM REACT RECOVER

After the alert...

What happens next?

ONit Alert™ **informs** key personnel with the vital information needed during an alarm. This allows your designated responders to **react** more quickly and effectively, bringing you to a faster **recovery**. ONit Alert™ integrates two-way communication between your key personnel and the central station with **Who's ONit™** and the action options being taken.

Providing uninterrupted service to your customers requires constant monitoring and the ability to respond almost instantly. We have seen first-hand what happens to clients' productivity when equipment unexpectedly breaks down. We often find that the traditional system is too limited to meet the facilities true needs. ONit Alert's goal is to provide industrial buildings and plants with critical information as fast as possible, and give them the tools with what to do next.

The ONit Alert solution will help industrial buildings and plants apply proven protocols and response plans to improve efficiency and effectiveness during critical moments, resulting in increased productivity and a very safe environment for its associates, customers and assets. ONit Alert is capable of a range of solutions, from securing and monitoring a single building to integrating with multiple buildings and remote locations.

Alarm and alert systems are crucial for industrial facilities. With the addition of ONit Alert, your basic monitoring and alarm system transforms into a next generation alarm. This new capability will alert you via text (SMS) and give you the ability to respond appropriately. The system then updates the key personnel and the central station based on those responses.

Our monitored alarms can be configured to work with virtually any type of device:

- Panic/Duress Buttons
- Fire Alarm
- Intrusion Alarm
- Power Failures
- Refrigeration Monitoring
- Gas Detection
- High/Low Temperature Sensors

Beyond security, ONit Alert' next generation monitoring can help optimize industrial and plant operations and provide business continuity. Now key personnel will able to react, communicate and respond within seconds of an alarm.
